# Main functionalities of the platform include:

- ✓ The platform currently focuses on two plant species: linden and apples, with the flexibility to add more species based on need.
- ✓ Automatic retrieval of images from cameras located on fields, orchards, etc.
- ✓ Manual creation of new data sources (images) for a specific logged-in user (via Google disk or local disk).
- ✓ Integration with the nearest weather stations to the data sources.
- ✓ Utilization of existing AI algorithms for automatic classification and semantic segmentation of linden and apples (ROI).
- ✓ Statistical analysis of data returned by the AI models for phenological analysis.

# AI models:

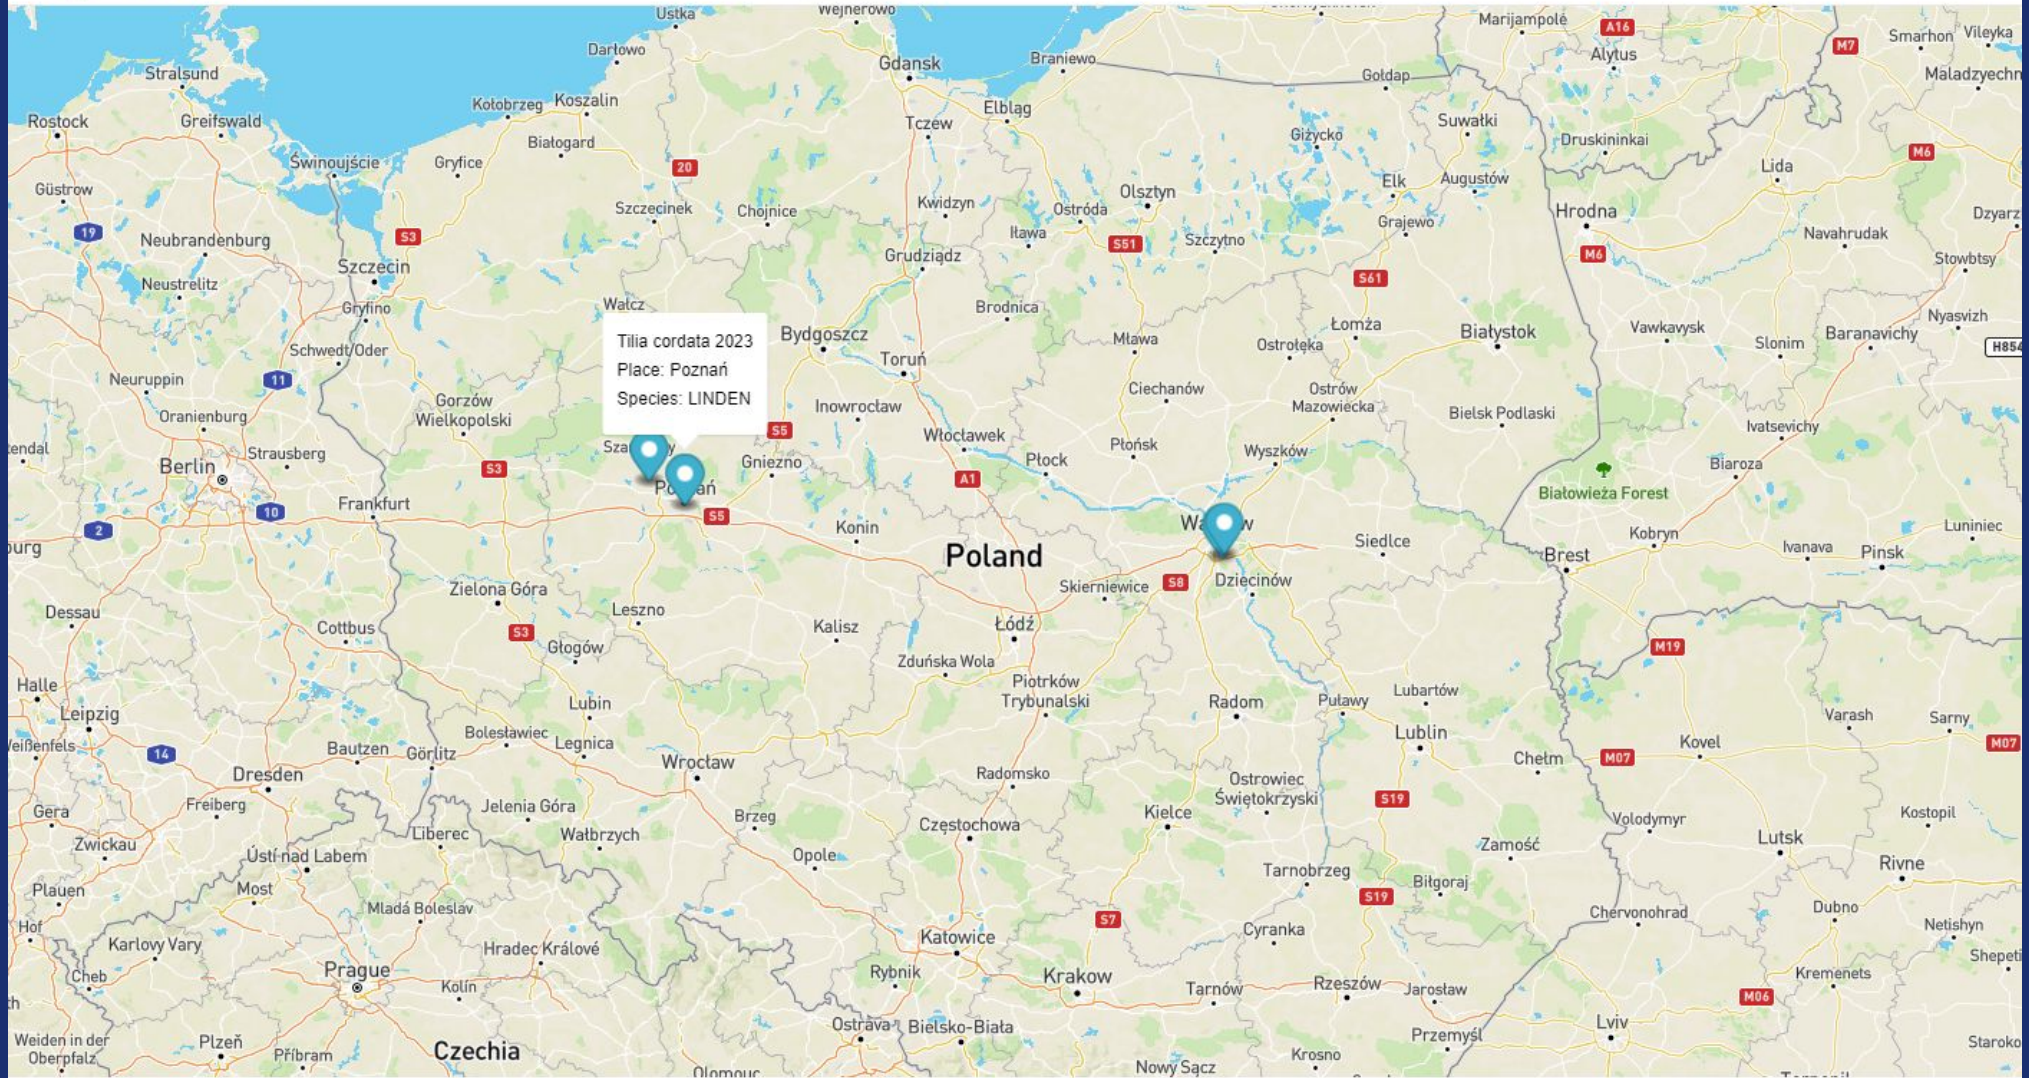

## For linden:

- Linden flowering classification (CNN)
- Semantic segmentation for Linden (Mask RCNN)

## For apples:

- Semantic segmentation for apples (Mask RCNN)
